

New in our portfolio:

btv testing

Sustainable technology which meets the highest quality levels

We now offer high-precision processes and methods for the targeted testing of electronic components!

The symbiosis of our almost 30 years of expertise in handling electronic components in combination with the best and most precise processes offers you as our customer a 100% satisfaction guarantee.

Prompt processing, detailed reporting, certified quality and the exchange with our experts from electronics development guarantee the successful implementation of your project requests.

The exclusive use of DAkkS-calibrated testing equipment as well as the professional implementation in a controlled climatic environment of an IATF 16949 certified service provider is our standard.

- Testing of assemblies and control units
- Selection of electronic components / semiconductors and sorting of dice
- Customer-oriented process development for test sequences
- Verification/classification of individual electrical properties of components above the test depth offered by the manufacturer
- Laser based depth measurement
- Optical 3D coplanarity inspection

In close cooperation with leading institutes, we also offer certified analyses in the areas of

- destructive material testing
- soldering tests
- artificial ageing
- and more...
